## What is a mammogram?

A mammogram is an X-ray of the breast. It is the best screening tool we have today to find breast cancer early, when it is most treatable. It can find breast cancer when it is very small, even too small to feel. It can also detect abnormal changes to the skin and calcifications. Mammography does a good job of finding cancer for most women. However, it is most accurate when used with another screening test called clinical breast exam.
