Metastatic Breast Cancer: Quality of Life

Treatment for metastatic breast cancer (MBC) focuses on extending and maintaining quality of life, including:

- Emotional and physical health
- Ability to perform daily roles
- Sexuality and intimacy
- Pain, fatigue and other side effects of treatment or the cancer itself

Symptom management

Managing side effects and other care that impacts your quality of life may be called palliative care. Palliative care is a main part of your cancer care.

You should never feel you have to endure pain or other side effects. Tell your doctor or nurse about any problems you’re having. They can help you control pain and manage symptoms, such as nausea and fatigue.

Some common symptoms and side effects, and ways to manage them include:

Nausea is a common side effect of some treatments. Your doctor can prescribe medicine to help ease it. For tips on managing nausea, click here.

Fatigue can be caused by treatment, depression, trouble sleeping or anemia (a low red blood cell count). Talk with your doctor about ways to manage your fatigue. Getting some physical activity (if you’re able) can help. Ask family and friends to help with day-to-day tasks.

Loss of appetite can be caused by treatment or the cancer itself. Although this can make it hard to eat, try to get enough calories, protein and nutrients. Food strengths your body. Light exercise (if you’re able) may help increase your appetite.

To prevent unwanted weight loss:

- Eat small, frequent meals and snacks.
- Eat your favorite foods.
- Add calories to meals with oils, sauces, avocado, nuts and nut butters.
- Sip on smoothies, milkshakes or protein drinks (such as Ensure and Boost).
- Drink plenty of water between meals instead of with meals to prevent fullness while eating.

For more tips, click here.

Pain is one of the biggest fears with cancer. Pain can almost always be managed.

Tell your doctor right away about any pain you have. Pain is easier to treat when you first have it. Waiting until the pain is severe can make it harder to control and may require more medicine.

Because pain can’t be seen, it’s hard to measure or describe. Keep a journal to help tell your doctor what you’re feeling.

Bone pain can be a side effect for people with bone metastases. Your doctor may prescribe bone-strengthening drugs to lower the risk of serious bone complications that cause pain such as bone fractures (breaks) and spinal cord compression. Bone pain can also be treated with heat, pain medications, radiation therapy or chemotherapy.

Diarrhea can be a side effect of some chemotherapy drugs and other drug therapies. Some ways to manage diarrhea are listed below. Talk with your doctor about which over-the-counter diarrhea medication to use and take it as prescribed. If it doesn’t work, you may need prescription medicine.

Ways to manage diarrhea:
• Eat small bland meals such as bananas, rice, applesauce, toast or plain pasta.
• Drink 8-10 large glasses of clear liquids (broth and sports drinks with electrolytes are good choices).
• Avoid dairy products, alcohol, caffeine and spicy foods.

If you’re having more than 4 loose bowel movements a day or the diarrhea doesn’t improve after 2 days, call your doctor. These are signs the diarrhea is serious and you need medical care.

Depression: A breast cancer diagnosis can bring on a wide range of feelings such as shock, fear, sadness, anger and grief. These feelings are normal, but they can also greatly impact your daily life, which could lead to emotional distress or depression. Talk with your doctor about how you’re coping. Depression needs to be treated. Some people find a support group or talking to a counselor or therapist helpful.

You are not alone
Many women and men have been where you are today. It may be helpful to talk with others. Your doctor can help you find a support group, a peer mentoring program or a counselor. The Komen Breast Care Helpline can also help you find support resources in your area. Call 1-877 GO KOMEN (1-877-465-6636) or email helpline@komen.org.
