

### RESEARCH SAVES LIVES

Complementary therapies—sometimes called integrative medicine—encompass many different therapies and are used together with conventional therapy to help prevent or treat breast cancer or lessen the side effects of treatment.

Complementary and integrative Therapies (CIT) refers to the use of **natural products** on the skin or in the diet, such as plant-derived compounds, herbals, or special diets; **mind-body medicine** such as paced breathing or meditation; and **body-based practices** such as massage, acupuncture, and exercises like yoga or Tai Chi.

Laboratory and clinical research has provided both “positive” (it may work) and “negative” (it may not work or be safe) evidence on the use of CIT. So, like any decision concerning your health, using CIT should be discussed with your doctor. Komen has long supported scientifically sound research into the use of CIT.

### OUR RESEARCH INVESTMENT: (1982-2019)

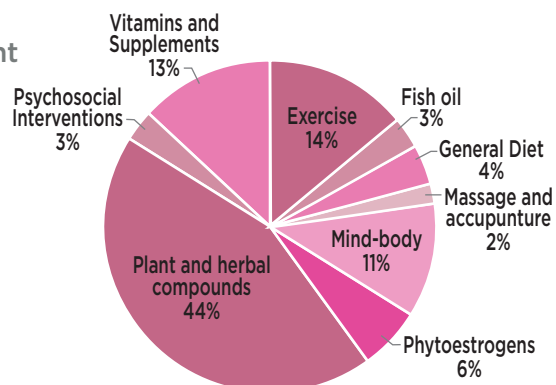

More than **\$26 million** in over **75 research grants** and more than **30 clinical trials** focused on CIT

### What We’re Investigating

- Conducting a clinical trial—the Breast cancer Weight Loss (BWEL) study—to test whether a weight loss program can reduce the risk of recurrence in overweight or obese women with stage II-III breast cancer.
- Testing whether short-term exercise and caloric restriction at specific times during chemotherapy treatment can prevent side effects, such as heart and muscle damage.
- Testing whether an exercise technique called low intensity, off loaded-compressive therapy (LOFT) can improve muscle strength, sleep quality and fatigue in breast cancer survivors.

### Topic Area of Total Investment

Komen Promise Grantees at the University of Kansas and the University of North Carolina tested flaxseed for the prevention of breast cancer.

### WHAT WE’VE LEARNED from Komen-funded research

-  Mindful meditation helps to relieve both physical and psychological symptoms of breast cancer, such as fatigue, anxiety and depression.
-  An 8-week Yoga of Awareness program may reduce the frequency and severity of hot flashes, joint pain, fatigue and insomnia.
-  Omega-3 fatty acid supplements can significantly reduce the joint pain that is a common side effect of aromatase inhibitors (AIs) in obese women with breast cancer.
